

# Kubernetes Cluster Analysis Report

**Cluster:** Nodes\_sitaid-s-aks-eastus-prod-001

**Generated:** 2025-10-27T15:03:17Z

## 1. Cluster Health Summary

● **Overall Health:** HEALTHY

### Key Metrics

Metric	Value
Total Pods	929
Total Nodes	29
Pods Missing Resources	596
OOM Events (Recent)	0
Pods with Restarts (24h)	3
Pods with Restarts (7d)	25
Node Issues	0
Namespaces at Risk	0

### ⚠ Potential Issues Identified

- **Missing Resource Requests and Limits:** 596 containers are missing resource requests or limits

## 2. Critical Issues (Top 5)

Issue #1: Missing Resource Requests and Limits

**Priority:** 1 (1=Highest)

**Description:** 596 containers are missing resource requests or limits

**Impact:** Prevents proper scheduling, impacts Velero backups, and can cause cluster instability

### Recommendation:

Set resource requests and limits for all containers based on observed usage patterns

### Examples:

- `asu/apveclient-7d56989558-nsh6m (container: apve-client)`
- `asu/apveweb-6c9cc5fc89-t8jb7 (container: apveweb)`
- `asu/arrdepapi-54fd8df557-rrk4x (container: arrdepapi)`

### Action Items:

1. Audit all pods using: `kubectl get pods --all-namespaces -o json | jq '.items[] | select(.spec.containers[].resources.requests == null)'`
2. Implement LimitRange in each namespace
3. Update deployment manifests with appropriate resource values
4. Use Vertical Pod Autoscaler to recommend resource values

## 3. Resource Management Analysis

Missing Resource Requests and Limits

- **Missing Both:** 190 containers
- **Missing Requests Only:** 0 containers
- **Missing Limits Only:** 406 containers

Impact on Cluster Operations

Velero Backups:

- Pods without resource requests may not be properly backed up
- Restore operations may fail due to resource allocation issues
- Recommendation: Set resource requests to ensure Velero can calculate backup requirements

System Pods:

- System pods may be evicted when resource-constrained workloads consume all node resources
- Can lead to cluster instability and monitoring gaps
- Recommendation: Implement ResourceQuota and LimitRange policies

Cluster Stability:

- Without requests, scheduler cannot make informed placement decisions
- Without limits, pods can consume excessive resources and impact neighbors
- May trigger cascading failures during traffic spikes

Short-Lived Jobs Impact

- **Total Jobs:** 87
- **Short Jobs (<2 min):** 85
- **Percentage:** 97.7%

**Impact:** High frequency of short-lived jobs can:

- Create scheduling churn and API server load
- Complicate resource capacity planning
- Impact cluster autoscaler effectiveness

Recommendations:

- Consider batching short jobs or using longer-running workers with queue patterns
- Set appropriate resource requests to prevent over-provisioning
- Implement job cleanup policies to prevent accumulation

Recommended Resource Allocation Strategy

```
# Example resource configuration
resources:
  requests:
    memory: "256Mi" # Based on observed baseline usage
    cpu: "100m"      # 0.1 CPU cores
  limits:
    memory: "512Mi" # 2x requests for burst capacity
    cpu: "500m"     # Allow bursting up to 0.5 cores
```

4. Node Analysis

✔ All nodes have healthy resource allocation.

5. Pod Restart Analysis

Summary

- **Last 24 Hours:** 3 pods with restarts (3 total restarts)
- **Last 7 Days:** 25 pods with restarts (25 total restarts)

Restarts in Last 24 Hours

Namespace	Pod	Container	Restart Count	Last Restart	Reason
dynatrace	apve-sit aids-aks-eastus-prod-001-activegate-0	activegate	426	2025-10-27 14:42	OOMKilled
rabbitmq	rabbitmq-3	rabbitmq	8	2025-10-27 13:49	OOMKilled
tigera-operator	tigera-operator-5595f8bdc b- ktk7h	tigera-operator	4	2025-10-27 06:03	Error

Additional Restarts in Last 7 Days (excluding above)

Showing top 20 of 22 containers:

... and 2 more containers

Analysis

Common Restart Reasons:

- **Completed:** 17 occurrences
- **OOMKilled:** 4 occurrences
- **Error:** 4 occurrences

Recommendations

1. Investigate High Restart Pods:

- Review logs: `kubectl logs <pod-name> --previous -n <namespace>`
- Check events: `kubectl describe pod <pod-name> -n <namespace>`

2. Address Common Issues:

- **OOMKilled:** Increase memory limits
- **Error:** Check application logs for errors
- **CrashLoopBackOff:** Fix application startup issues
- **Liveness probe failures:** Adjust probe timing or fix health checks

3. Set Proper Resource Limits:

- Ensure memory and CPU limits are appropriate
- Use VPA to get right-sizing recommendations

4. Implement Monitoring:

- Set up alerts for high restart rates

- Track restart trends over time
- Monitor resource usage patterns

6. Flux Events Analysis

Summary

- **Last 24 Hours:** 676 events (0 warnings, 0 errors)
- **Last 48 Hours:** 676 events (0 warnings, 0 errors)

Recommendations

1. **Review Warning Events:** Check Flux reconciliation failures
2. **Check Source Repositories:** Verify Git repositories are accessible
3. **Validate Manifests:** Ensure Kustomization and HelmRelease manifests are valid
4. **Monitor Flux Components:** Check flux-system namespace pod health

7. Non-Flux Warning Events

Summary

- **Last 24 Hours:** 6 warning events
- **Last 48 Hours:** 6 warning events

Warning Events in Last 24 Hours

Namespace	Object	Reason	Message	Count	Last Seen
dynatrace	Pod/apve-sit aids-aks-eastus-prod-001-oneagent-djbgw	Unhealthy	Readiness probe failed: /bin/sh: line 1: grep: command not found	35283	2025-10-27 15:00
dynatrace	Pod/apve-sit aids-aks-eastus-prod-001-activegate-0	Unhealthy	Readiness probe failed: HTTP probe failed with statuscode: 503	6328	2025-10-27 14:59
cgr	Pod/deviceconfiguration-594b96f74f-s246v	Unhealthy	Liveness probe failed: Get "https://10.244.7.154:443/health": net/http: request canceled while wa...	49	2025-10-27 14:55
default	Node/aks-user002-17014027-vmss00000p	OOMKilling	Memory cgroup out of memory: Killed process 3055836 (java) total-vm:5067764kB, anon-rss:861544kB,...	2	2025-10-27 14:42
cgr	Pod/deviceconfiguration-594b96f74f-s246v	Unhealthy	Liveness probe failed: Get "https://10.244.7.154:443/health": context deadline exceeded	13	2025-10-27 14:10
default	Node/aks-user002-17014027-vmss00000p	OOMKilling	Memory cgroup out of memory: Killed process 3006748 (java) total-vm:5063648kB, anon-rss:862584kB,...	2	2025-10-27 14:02

Recommendations

1. **Investigate Frequent Warnings:** Focus on events with high counts
2. **Check Resource Issues:** Look for scheduling, mounting, and resource-related warnings
3. **Review Pod Health:** Investigate liveness/readiness probe failures
4. **Monitor Trends:** Track if warning events are increasing over time

8. Velero Backup Analysis

Summary

- **Last 24 Hours:** 21 backups (0 failed)
- **Last 48 Hours:** 42 backups (0 failed)

Backups in Last 24 Hours

Analysis

Average Backup Duration: 0.3 minutes

Recommendations

1. Review Failed Backups:
- Check logs: `velero backup describe <backup-name>`

◦ Review errors: `velero backup logs <backup-name>`
2. Validate Backup Schedule:
- Ensure backups are running at expected intervals

◦ Check backup retention policies
3. Monitor Backup Storage:
- Verify backup storage location is accessible

◦ Check available storage space
4. Test Restore Process:
- Regularly test backup restoration

◦ Validate backup integrity

9. RabbitMQ Stability Analysis

RabbitMQ Pods Found: 5

- `rabbitmq/rabbitmq-0`

• `rabbitmq/rabbitmq-1`

• `rabbitmq/rabbitmq-2`

• `rabbitmq/rabbitmq-3`

• `rabbitmq/rabbitmq-4`

Current Configuration

- ✔ Priority Class Configured: false

• ✔ Resource Limits Set: true

Recommendations for Maximum Stability

1. Create High-Priority PriorityClass

```
apiVersion: scheduling.k8s.io/v1
kind: PriorityClass
metadata:
  name: rabbitmq-critical
value: 1000000 # Higher than system-cluster-critical (2000000000 reserved for system)
globalDefault: false
description: "Priority class for RabbitMQ to prevent eviction"
```

2. Configure RabbitMQ Pod Resources

```
apiVersion: v1
kind: Pod
metadata:
  name: rabbitmq
```

```
spec:
  priorityClassName: rabbitmq-critical
  containers:
  - name: rabbitmq
    resources:
      requests:
        memory: "2Gi"      # Set based on your observed usage
        cpu: "1000m"        # 1 full CPU core
      limits:
        memory: "4Gi"      # Allow headroom for spikes
        cpu: "2000m"        # Allow burst capacity
```

3. Add PodDisruptionBudget

```
apiVersion: policy/v1
kind: PodDisruptionBudget
metadata:
  name: rabbitmq-pdb
spec:
  minAvailable: 2 # For clustered RabbitMQ
  selector:
    matchLabels:
      app: rabbitmq
```

4. Node Affinity (Optional)

Consider dedicating specific nodes for RabbitMQ:

```
affinity:
  nodeAffinity:
    preferredDuringSchedulingIgnoredDuringExecution:
    - weight: 100
      preference:
        matchExpressions:
        - key: workload-type
          operator: In
          values:
          - messaging
```

How This Ensures RabbitMQ is Last to be Evicted

- 1. **PriorityClass:** Kubernetes evicts lower-priority pods first during resource pressure
- 2. **Resource Requests:** Guarantees RabbitMQ gets its requested resources
- 3. **Resource Limits:** Prevents RabbitMQ from being OOMKilled unnecessarily
- 4. **PodDisruptionBudget:** Prevents voluntary disruptions during maintenance

10. Namespace-by-Namespace Analysis

● Medium Risk Namespaces

Namespace: jub

Metric	Value
Total Pods	26
Pods Missing Requests	7
Pods Missing Limits	24
Risk Level	MEDIUM

Critical Pods Missing Resources:

- apveweb-588468fbfc-n2zfp

- sqldailyjob-29358735-zslhh

... and 1 more pods

Recommended Actions:

- Priority: LOW (24.0% pods affected)
- Implement LimitRange to set defaults for new pods
- Update existing deployments with appropriate resource requests/limits
- Monitor resource usage patterns for 1-2 weeks before setting permanent values

Namespace-Level Recommendations

1. Implement LimitRange defaults:

```
apiVersion: v1
kind: LimitRange
metadata:
  name: default-limits
  namespace: <namespace>
spec:
  limits:
    - default:
        memory: 512Mi
        cpu: 500m
      defaultRequest:
        memory: 256Mi
        cpu: 100m
      type: Container
```

2. Set ResourceQuota per namespace:

```
apiVersion: v1
kind: ResourceQuota
metadata:
  name: namespace-quota
  namespace: <namespace>
```

```
spec:
  hard:
    requests.cpu: "10"
    requests.memory: 20Gi
    limits.cpu: "20"
    limits.memory: 40Gi
```

## 11. AI-Enhanced Insights

# Kubernetes Cluster Analysis Report

### 1. Cluster Health Summary

The cluster currently hosts 929 pods across 29 nodes and is marked as healthy. However, there are significant concerns regarding resource management, particularly with 596 pods missing resource requests and limits which can lead to poor scheduling decisions and potential instability.

### 2. Critical Issues

#### 2.1 Missing Resource Requests and Limits

- **Impact:** Without defined requests and limits, the Kubernetes scheduler cannot make informed decisions, potentially leading to node overcommitment or resource starvation for critical workloads.
- **Action:** Implement a policy where all deployments must have resource requests and limits defined based on metrics collected from monitoring tools (like Prometheus). Use historical data to set initial values, and adjust based on ongoing performance metrics.

#### 2.2 RabbitMQ Stability

- **Impact:** RabbitMQ does not have a priority class assigned, which could result in its pods being evicted in resource contention scenarios.
- **Action:** Assign a high-priority class to RabbitMQ pods to ensure they are last in line for eviction. Additionally, review and adjust resource limits to align with actual usage and peak loads observed.

#### 2.3 Management of Short-Lived Jobs

- **Impact:** A high number of short-lived jobs can cause scheduler churn and may impact the responsiveness of the control plane.
- **Action:** Implement a job queueing system or rate limit the creation of these jobs to smooth out the load on the scheduler.

### 3. Resource Management

#### 3.1 Velero and System Pods

- **Recommendation:** Ensure Velero and other critical system pods have appropriate resource requests and limits to guarantee their availability and performance, especially during backup operations which are resource-intensive.

#### 3.2 Impact of Short-Lived Jobs

- **Analysis:** Frequent short-lived jobs can lead to temporary but significant resource spikes. Implementing resource requests and limits will help in providing a more stable environment by ensuring these jobs do not starve other critical services of resources.

### 4. Node Analysis

#### 4.1 Resource Allocation and Balance

- **Finding:** Some nodes may be experiencing higher loads due to uneven pod distribution or pods with high resource demands.
- **Action:** Use Kubernetes' cluster autoscaler to dynamically adjust the number of nodes based on need. Review and optimize pod anti-affinity rules to improve the distribution of workloads across the cluster.

#### 4.2 OOMKilled Events and High Requests

- **Preventive Measure:** Regularly monitor and adjust pod resource limits based on trends and spikes observed in usage data to prevent OOMKilled events.

### 5. RabbitMQ Stability

#### 5.1 Priority and Resources

- **Implementation:**

```
apiVersion: scheduling.k8s.io/v1
kind: PriorityClass
metadata:
  name: rabbitmq-priority
value: 1000000
globalDefault: false
description: "Priority class for RabbitMQ pods to ensure they are the last to be evicted"
```

- **Resource Allocation Strategy:** Review performance metrics and set requests close to the average usage and limits slightly above the peak usage observed.

## 6. Namespace Analysis

### High Priority Namespaces (Medium Risk)

- **Namespaces:** jub, lad, ord, asu, pvd, fca, guc, ben, bsr, skb, day
- **Action:** Audit and update each pod in these namespaces with specific resource requests and limits. Start with pods that are most critical to application function or have shown resource strain.

### Lower Priority Namespaces (Low Risk)

- **Namespaces:** cmg, mab, pmg, cgr, atm, cks, moc, cgh, stm, uba, udi
- **Action:** Follow similar procedures as medium-risk namespaces but prioritize after high-risk namespaces.

## Recommendations for Automation and Preventive Measures

- **Automation:** Implement CI/CD pipelines to enforce resource limit policies.
- **Monitoring and Alerts:** Set up alerts for anomalies in resource usage to catch issues before they impact the cluster health.

By addressing these critical issues and implementing the recommended actions, the stability and performance of the Kubernetes cluster can be significantly improved.

### Enhanced Recommendations

- AI analysis provided in summary section

### Risk Assessment

See AI summary for detailed risk assessment

### Automation Suggestions

- Implement ResourceQuota policies
- Set up LimitRange defaults for namespaces
- Configure PodDisruptionBudgets for critical workloads

## Appendix

### A. Data Collection Summary

- **Collection Time:** 2025-10-27T15:03:17Z
- **Total Pods Analyzed:** 929
- **Total Nodes Analyzed:** 29
- **Events Processed:** 991
- **Metrics Available:** ✓ Yes (842 pods with metrics)

### B. All Active Pods - Resource Configuration

Complete inventory of all running pods with their resource requests, limits, and current usage.

Resource Configuration Summary

- **Total Running Containers:** 989
- **Fully Configured** (requests + limits): 233 (23.6%)
- **Missing Requests:** 176 (17.8%)
- **Missing Limits:** 756 (76.4%)

C. Next Steps

1. Review critical issues and prioritize based on business impact
2. Implement resource requests/limits for high-risk namespaces first
3. Set up monitoring for OOM events and resource utilization
4. Establish policies (LimitRange, ResourceQuota) to prevent future issues
5. Schedule follow-up analysis after implementing changes

D. Useful Commands

Get pods without resource requests:

```
kubectl get pods -A -o json | jq -r '.items[] | select(.spec.containers[].resources.requests == null) | "\n(.metadata.namespace)/\n(.metadata.name) "'
```

Get resource usage for a namespace:

```
kubectl top pods -n <namespace>
```

View pod resource configuration:

```
kubectl get pod <pod-name> -n <namespace> -o jsonpath='{.spec.containers[*].resources}'
```
